Radiation Protection in Fluoroscopy

Dennis Bowman, RT(R), CRT (R)(F) - Retired Owner/Consultant - Digital Radiography Solutions

Instructional DVD – Edition 3

FluoroRadPro us

Radiation Protection in Fluoroscpy (3rd Edition)

FluoroRadPro

Radiation Protection in Fluoroscopy & Digital Radiography

COURSE BENEFITS

- Decreased fluoroscopic dose to patients and staff
- Improved fluoroscopic and digital image quality
- Maximal efficient use of fluoroscopic and DR equipment
- Effective implementation of optimal CR and DR techniques
- Working knowledge of standardized exposure index numbers and ranges
- Heightened awareness of 'safe areas' during fluoroscopy in the OR and R&F room
- Improved understanding of radiation attenuation and scatter
- Elevated staff performance
- Enhanced digital image critique skills

COURSE HIGHLIGHTS

- Ion chamber at head, 45, and 90 degrees in OR and R&F room
- Adverse events and biologic effects
- Radiation changes with increased SID
- X-table lateral hip location of the least amount of scatter
- CIRS pediatric phantom with pediatric versus adult settings
- Vertical collimation

dĸs"

- Fluoroscan mini c-arm
- Universal CR and DR technique charts
- Dose reduction using the 15% Rule with mAs compensation

What you'll learn

- \checkmark Understand how radiation scatters and in what direction during an AP chest
- $\checkmark~$ Explain how to correctly use and set up a C-arm
- $\checkmark\,$ Discuss the difference in dose between 1fps, 2 fps, and 3 fps with digital spots
- \checkmark Understand how to properly use a C-Arm to get the clearest, sharpest image
- \checkmark Explain how much radiation is saved when Pulse Mode is used
- $\checkmark\,$ Discuss the difference in scatter between the head, 45 and 90 degrees in OR
- ✓ Explain the Inverse Square Law
- $\checkmark~$ Understand ABS and how mA and kV change when using fluoroscopy
- \checkmark Discuss the difference between 0.25, 0.375, and 0.5 mm lead aprons

cloverlearning.com

Demonstrating attenuation with my "poor man's body phantom" using polyethylene blocks and 500cc saline bags.

85 kV @ 14 mAs 45" 14x17 Entrance 2.13 r 0%

Anterior Quarter 1.05 R +49.3% (-50.7%)

Middle – Midline Dose (MD) 0.469 R +22% (-78%)

Posterior Quarter 0.195 R +9.2% (-90.8%)

Exit 0.051 R +2.4% (-97.6%)

Under Grid (in bucky) 0.0075 R +.4% (-99.6%)

How much dose are you getting from scatter radiation coming out of your patient during an AP chest?

We did this experiment with and without grids, at 115 and 85 kV, and at 3 different angles. This one is taken at 90 degrees to the patient.

This one is taken at 45 degrees to the patient.

And this one we are calling 0 degrees.

Natural Background Radiation – 2006 (Cosmic, Radon, Potassium 40)

Ir = 1 rad (in air)

- IR = 1 Roentgen (radiation has touched the body)
- 1 milliR (mR) = 1/1000 of a rad/Roentgen
- 1 microR (μ R) = 1/1000 of a mR
- Natural Radiation = 304 milliR/year
- 304 milliR = 304,000 microR
- 304,000 microR/year = <u>844 microR/day</u>

Here are all the doses for 0, 45 and 90 degrees (arrows at 6')

85@3.2

and

115@4

0	16	8.3	8.2	8.3

Chest technique of 115@4 was used for all exposures. Ionization Chamber angle is measured from mid sagittal plane.

This demonstration used the arm/hand phantom and a 10x12 CR cassette. We set it up where many techs stand when making a PCXR exposure. This photo and the following image have the cassette at: 45 degrees and 12 feet from the patient.

An image cannot lie!! Although the scatter dose is down in the micro R's, there's enough radiation to create this image – with 1 exposure (**read at 1200 speed**).

This photo and the following image were taken with the phantom/cassette 12 feet from the patient directly behind the tube (which is 6 feet from the patient).

The 85 kV image had 6.0 microR and the 115kv image had 17 microR.

12' FROM PATIENT DIRECTLY BEHIND TUBE 6' DIRECTLY BEHIND TUBE 85 KV @ 3.2 MAS

1 EXPOSURE

12' FROM PATIENT DIRECTLY BEHIND TUBE6' DIRECTLY BEHIND TUBE115 KV @ 4 MAS

1 EXPOSURE

This photo and the following image were taken with the phantom/cassette 12 feet from the patient, 90 degrees from the patient.

Of all the images, the one on the left shows the least amount of radiation made it to the radiographer (but it's not no radiation and it's the best place to stand).

1 EXPOSURE

85 KV @ 3.2 MAS 12 FT 90 DEGREES

117 KV @ 4 MAS 12 FT 90 DEGREES

If you're thinking like we were, then you're wondering if the scatter came from the back of the tube, not the patient? It turns out that at 12 inches from the backside of the tube the dose was so small that the dosimeter could not read it.

The perfect place to stand when making an exposure is directly behind the tower. You lean your head out while giving the breathing instructions, then move your head back behind the tower while making the

exposure.

X - T A B L E L A T E R A L H I P COCATION OF THE LEAST AMOUNT OF SCATTER

I always thought ours was the bad side as the exiting radiation was now larger than the II and would keep coming back towards the tech. We are starting on the radiographers side. Ion chamber at 60 degrees toward feet at **18**".

Split Second Exposure (SSE) = 9.4 μR Spot exposure = 17.7 μR

Ion chamber on techs side at 90 degrees at 18"

Here are the differences between the surgeon and the tech side of the table. All of the surgeon side readouts are now in MicroR's (uR).

- •45 degrees to head 11.9 vs 468 = 39 times more
- •60 degrees to head 12.8 vs 628 = 49 times more
- •90 degrees to pt. 15.6 vs 881 = 56 times more
- •60 degrees to foot 17.7 vs 969 = 54 times more

Proving that everyone on the tube side is getting infinitely more radiation than the II side and it is your job to protect them as well as you can.

DEMONSTRATION OF THE INVERSE SQUARE LAW

We added this chart to remind you when you double the distance, you will have 1/4th of the dose, when you triple the distance you have 1/9th the dose, and when you quadruple the distance you have you have 1/16th the dose.

The Inverse Square Law

Distance from source	Intensity	Inverse square relationship
ЭС	I	I
2.00	<u>1</u> 4	$\frac{\mathbf{I}}{2^2}$
3 00	<u>1</u> 9	$\frac{\mathbf{I}}{3^2}$
4 oc	<u>I</u> 16	$\frac{\mathbf{I}}{4^2}$

FRP

We wanted to use the C-Arm so that you can see how important it is to get distance when you can because there is no lead shield hanging to protect you.

We made exposures at 2', 4', 6' and 8'. Exposures will be with the digital spot, so they'll all be identical.

OEC

CONMED

The ion chamber is at a height even with the middle of the phantom.

Here is the first exposure at 2'.

Here we are at 4 feet.

The readout at 4' is 119.0 μ R.

Now we have the ion chamber at 6'.

The readout at 6' is 50.3 μ R.

Now we're at 8'.

2' was our starting point or base - .428 mR

The Inverse Square Law

Distance from source	Intensity	Inverse square relationship

This demonstration was to show you that whenever possible, don't ever be this close to your patient.

Instead, be here.

But you'd rather be here.

Although this is better.

Of course, stepping back as far as the cord will allow is always the best place to stand, **because distance is your friend!!**

LEAD APRONS

This experiment was to show the difference in dose getting through a .25, .375 and .5 equivalent lead shield (using the .5 as the standard). The tube is set at 40" and is collimated to a 12"x12."

The .25 and .375 aprons are letting through anywhere between 1.3 to over 22.3 times more radiation!!

Lead Apron Study, Using Abdomen Phantom w/ meter perpendicular, meter 2" away from left side. Doses are an average of three different types of lead aprons.

The New Shielding Debate

In April 2019, the AAPM announced in PP 32-A "AAPM Position Statement on the Use of Patient Gonadal and Fetal Shielding" that:

- Patient gonadal and fetal shielding during X-ray based diagnostic imaging should be discontinued as routine practice."
 - Patient shielding may jeopardize the benefits of undergoing radiological imaging. Use of these shields during X-ray based diagnostic imaging may obscure anatomic information or interfere with the automatic exposure control of the imaging system."

"These effects can compromise the diagnostic efficacy of the exam, or actually result in an increase in the patient's radiation dose."
"Because of these risks and the minimal to nonexistent benefit associated with fetal and gonadal shielding, AAPM recommends that the use of such shielding should be discontinued."

The ASRT's response

- The ASRT Board of Directors immediately issued two statements in response. They were:
- The first confirmed their support to avoid contact shielding of the fetus and gonads, but only during radiographic imaging of the abdomen and pelvis.
- The second clarified that other patient shielding should continue as a best practice, if there is no risk of the shielding interfering with procedural efficacy of leading to increased patient dose.

Off-Focus Radiation

Art courtesy of "Principles of Radiographic Imaging" by Rick Carlton Checking to see if it is wiser to shield a patient in the front or the back for a PA chest x-ray. Collimated to 14x17 with shield and cassette below primary beam.

Because of Off-Focus Radiation, the shield needs to be placed on the side of the tube

If your patient is pregnant, you might consider double shielding on the tube side.

With our new "double lead" roller shield, we only need to put on a wrap-around apron in the front.

At CHOMP, because of the Off-Focus Radiation, all of our upright abdomens are now taken PA.

From an Original Article in Radiologic Technology ("Reducing Pediatric Patients' Dose by Manipulating Radiographic Projections" Nov/Dec 2021), Brennan and Madigan found that during a PA lumbar projection compared with the AP projection, the absorbed dose was reduced by 39%.

Organization for Occupational Radiation Safety in Interventional Fluoroscopy

ORSIF Organization for Occupational Radiation Safety in Interventional Fluoroscopy

FRP

They have this incredible video called "Invisible Impact: The Risk of Ionizing Radiation on Cath Lab Staff".

ORSIF

Organization for Occupational Radiation Safety in Interventional Fluoroscopy

Invisible Impact: The Risk of Ionizing Radiation on Cath Lab Staff

FRP

Video centers on Dr. Edward Diethrich, was one of the top cardiac surgeon's in the US, who used a C-arm in the OR.

Adaptive Radiography: Tips and Tricks

ADAPTIVE RADIOGRAPHY with TRAUMA, IMAGE CRITIQUE AND CRITICAL THINKING

> Quinn B. Carroll Dennis Bowman

VERTICAL COLLIMATION

This lesson is to show how much dose can be saved by using collimation. We taped nails every inch across a film jacket.

SIGN OUT ALL FILMS BEFORE REMOVING FROM RADIOLOGY DEPARTMENT

We then put the film jacket under the thorax phantom.

The ion chamber is 24" from the midline of the phantom and at mid coronal height.

We started with a little bit of collimation so that the edge of the collimated beam is just against the outer most nails.

Making a 10 second exposure. Standing as far away as possible since we had to take the hanging lead off.

The dose was 0.199 mR.

Now we have collimated one inch on each side.

Making the 10 second exposure with 1" of collimation in each side.

The dose was 160.6 μR (not mR). It would be 0.160 mR.

Now I have collimated 2" per side.

Making the 10 second exposure with 2" of collimation on each side.

The dose was 112.0 μR (not mR). It would be 0.112 mR.

No one really collimates any tighter side to side, so I won't go more than that.

Vertical Collimation

- None 0.199 mR
- **1**in 0.161 mR
- 2in 0.112 mR
- 1in Decreased dose 20% of no collimation
- 2in Decreased dose 44% of no collimation

We now want to show how the image gets mag-ed up (not the good mag) and distorted when the II is higher, causing more OID.

With II just above the patient, we are seeing 10 nails with ribcage on both sides.

Emergency, 405 8-05-2016	COMMUNITY HOSPITAL OF MONTEREY FLUOROSPOT 08-05-2016 1:16:43	Emergency ADB Single Single Single Single Single Single <t< th=""><th></th></t<>	
NY: 90 IMA: 2.3 D: 100	H: 30 % F: 20 % WW: 588 WC: 384	72 W 93 W 13 mÅ 15 min 15 min	

Now we have raised the II exactly 6 inches.

The ribcage and outermost nails are gone.

In addition to less anatomy, there is also distortion occuring.

You can see that the outermost nails have a slight bend to them and there is more room between the outside nail.

When the II is lifted you get more scatter which degrades the image quality, more dose to everyone in the room, and distortion on the sides of the image.

HOW MUCH RADIATION IS Saved Using Pulse Modes?

Although we are showing pulse modes in the OR with a c-arm, the same pulse mode settings are in all fluoro, interventional and cardiac cath labs.

+m

As I pan up and down the body, 1 PPS is so choppy that it is almost never used.

Fluoro-ing for 10 seconds at 1 PPS and not moving the II.

The dose using 1 PPS for 10 seconds is: 0.14 mGy

As I pan up and down the body, 2 PPS is still too choppy. Again, it is barely ever used.

Fluoro-ing for 10 seconds at 2 PPS.

The dose using 2 PPS for 10 seconds is: 0.23 mGy

4 PPS is the best yet, but it is still pretty choppy. Usually a physician will only use it if missing chunks of anatomy/pathology is not a big deal.

Fluoro-ing for 10 seconds at 4 PPS

The dose using 4 PPS for 10 seconds is: 0.36 mGy

As I fluoro at 8 PPS the image is barely choppy at all. This is why 8 PPS is used almost all the time.

Fluoroing for 10 seconds at 8 PPS

The dose using 8 PPS for 10 seconds is: 0.48 mGy

We wanted to show what the dose will be with 10 seconds of fluoro using the 15 PPS.

The dose using 15 PPS for 10 seconds is: 1.66 mGy

Now we want to show you how much more dose there is using the regular default setting (no PPS set).

> my

The dose using no PPS for 10 seconds is: 3.26 mGy

Here are the compared doses for the Pulse Modes. They are all compared to the No Pulse.

No Pulse – 3.26 mGy =

15 PPS – 1.66 mGy = 49.1% less

- 8 PPS 0.48 mGy = 85.3% less
- 4 PPS 0.36 mGy = 89.0% less
- 2 PPS 0.23 mGy = 92.9% less
- I PPS 0.14 mGy = 95.7% less

I have 4 PPS set to show that a second of fluoro is not really a second of fluoro. It took 9 seconds of actual time for the c-arm to record 2 seconds.

> *кVр* 86

FLUORO

10 (A)

DOSE DIFFERENCE BETWEEN MAGNIFICATION MODES

Most c-arms have 2 mag modes while most R/F rooms have a third setting.

We're using the thoracic phantom in a lateral projection. All exposures will be for 2 seconds.

This is the default/no mag setting. You can count almost 8 vertebrae. This is the full 12" image. Note that the readout was 0.38 mGy.

Now we'll make the exposure on Mag 1.

Mag 1 takes the 12" to a 9" image. You can now see just over 5 vertebrae. The dose at Mag 1 is now 0.51 mGy.

Vas 15

Now we're set up on Mag 2.

Mag 2 takes the image from 12" to 6". You can now see just under 4 vertebrae. The dose readout at Mag 2 is 0.84 mGy

This is the good way to mag. You never want to mag by moving the II further away from your patient, which just increases the OID.

Dose Differences with Mag Modes

Regular – .38 mGy Starting point - Base
Mag 1 – .51 mGy Dose increased by 34%
Mag 2 – .84 mGy Dose increased by 121%

Always be willing and ready to suggest to the surgeon that mag-ing an image could be very helpful. *There will be more dose, but it is worth it.*

LOW DOSE VERSUS DEFAULT SETTINGS

Also might be called pediatric settings. It cuts the mA in half and gives a higher kV. It has a much lower dose, but a nosier image.

OPCS OF

Making the first exposure.

First exposure made and sent to the right screen. It was 97 kV @ 3.18 mA.

Vas 15

Now set on Low Dose button. This will cut the mA to half and usually increase 3-4 more kV.

Second exposure made with Low Dose.

Image on left is Low Dose and on right is regular default setting.

10

You can see that the image on the left has more noise, but it also used less than half the dose. 97 kV to 96 kV and 3.18 mA to 1.36 mA.

Any time you think that the image does not have to be perfect, ask the physician if Low Dose can be used, as it utilizes ½ the mA.

We will reset everything and make 30 second exposures so we can compare the dose.

30 Second exposure made on default/regular setting.

It was 9.43 mGy.

Now we are making a 30 second exposure on the Low Dose setting.

The dose was 4.44 mGy.

The Low Dose was 4.44 mGy and the regular setting was 9.43 mGy.
